CLAIM LISTING SHOWING CLAIM AMENDMENTS

Claims 1-5 (Canceled)

In a locking device having a locking head 6. (Currently Amended)

movable between a locked and an unlocked state, a shackle member including a

linear shank having an outer surrounding surface, first and second end portions and

a length and a thickness, said shackle member including a latch portion disposed at

the shank first end portion and configured to engage said locking head, and a stop

member disposed at the shank second end portion, a method for varying the

diameter of the linear shank to adapt the locking device to variable sized apertures in

components to be locked with said device, said method comprising the steps of:

providing a sleeve with an inner diameter sized to closely fit over said (a)

shank in an engaged position with said sleeve having an inner surrounding surface

and a sleeve length sufficient to extend over a majority of the length of said shank

when in the engaged position with the inner surrounding surface of said sleeve in

substantially confronting relation with the outer surrounding surface of said shank

over substantially the length of said sleeve thereby to achieve a close-fitted mated

engagement with said shank;

in the alternative, either (b)

> telescopingly engaging said sleeve onto said shank and (i)

thereafter positioning said shank and sleeve together within one sized

aperture or

positioning said shank without said sleeve being engaged (ii)

thereon within another sized aperture; and

thereafter engaging said locking head with said latch portion. (c)

Page 2 of 9

7. (Original) The method according to claim 6, including the step of

resisting removal of said sleeve from said shank by providing a compressible

resilient element operative to engage said sleeve and said shank when said sleeve

is in the engaged position.

Claims 8-18 (Canceled)

19. (Previously Presented) In a locking device having a locking

head movable between a locked and an unlocked state, a shackle member having a

linear shank with a thickness dimension and first and second end portions, a latch

portion disposed at the shank first end portion configured to engage said locking

head, and a stop member disposed at the shank second end portion, a method for

varying the diameter of the linear shank to adapt the locking device to variable sized

apertures in components to be locked with said device, said method comprising the

steps of:

(a) providing a plurality of sleeves each having a common inner diameter

for telescopingly engaging said shank and a different outer diameter;

(b) selecting a sleeve having an outer diameter corresponding to the size

of the apertures in the components to be locked;

(c) telescopingly engaging the selected sleeve onto said shank;

(d) retaining the selected sleeve in position on said shank;

(e) positioning said shank and selected sleeve within apertures of the

components to be locked; and

(f) engaging said locking head with said latch portion.

20. (Previously Presented) In a loc

In a locking device having a locking

head movable between a locked and an unlocked state, a shackle member having a

linear shank with a thickness dimension and first and second end portions, a latch

Page 3 of 9 July 27, 2006 SN: 10/752,931 AMENDMENT portion disposed at the shank first end portion configured to engage said locking

head, and a stop member disposed at the shank second end portion, a method for

varying the diameter of the linear shank to adapt the locking device to variable sized

apertures in components to be locked with said device, said method comprising the

steps of:

(a) providing a plurality of sleeves having variable inner and outer

diameters and configured to be selectively nested within each other;

(b) selecting one or more nested sleeves having a combined outer

diameter corresponding to the size of the apertures in the components to be locked;

telescopingly engaging the selected combination of sleeves onto said

shank;

(c)

(d) retaining the selected combination of sleeves in position on said shank;

(e) positioning said shank and selected combination of sleeves within

apertures of the components to be locked; and

(f) engaging said locking head with said latch portion.

21. (Previously Presented) In a locking device having a locking

head movable between a locked and an unlocked state, a shackle member having a

linear shank with a thickness dimension and first and second end portions, a latch

portion disposed at the shank first end portion configured to engage said locking

head, and a stop member disposed at the shank second end portion, a method for

varying the diameter of the linear shank to adapt the locking device to variable sized

apertures in components to be locked with said device, said method comprising the

steps of:

(a) providing a sleeve with an inner diameter sized to closely fit over said

shank;

Page 4 of 9 July 27, 2006 SN: 10/752,931

telescopingly engaging said sleeve onto said shank; (b)

retaining said sleeve in position on said shank by providing an annular (c)

groove in said shank proximate the latch portion thereof, and then positioning a

retaining member in said groove about said shank after the sleeve has been

telescopically positioned onto said shank;

positioning said shank and sleeve within apertures of the components (d)

to be locked; and

engaging said locking head with said latch portion. (e)

In a locking device having a locking 22. (Currently Amended)

head movable between a locked and an unlocked state, a shackle member having a

linear shank with a thickness dimension and first and second end portions, a latch

portion disposed at the shank first end portion configured to engage said locking

head, and a stop member disposed at the shank second end portion, a method for

varying the diameter of the linear shank to adapt the locking device to variable sized

apertures in components to be locked with said device, said method comprising the

steps of:

providing a sleeve with an inner diameter sized to closely fit over said (a)

shank;

telescopingly engaging said sleeve onto said shank; (b)

retaining said sleeve in position on said shank by providing a first set of (c)

threads on one end portion of said sleeve and a second set of threads on said stop

member, and then threadably engaging said sleeve with said stop portion member

after said sleeve has been telescopically positioned onto said shank;

positioning said shank and sleeve within apertures of the components (d)

to be locked; and

July 27, 2006 SN: 10/752,931

engaging said locking head with said latch portion. (e)

> In a locking device having a locking (Previously Presented)

head movable between a locked and an unlocked state, a shackle member including

a linear shank having first and second end portions and a length and a thickness,

said shackle member including a latch portion disposed at the shank first end portion

and configured to engage said locking head, and a stop member disposed at the

shank second end portion wherein said locking head and said shackle member may

be completely disconnected from one another as two independent pieces, a method

for varying the diameter of the linear shank to adapt the locking device to variable

sized apertures in components to be locked with said device, said method

comprising the steps of:

23.

providing a sleeve with an inner diameter sized to closely fit over said (a)

shank in an engaged position with said sleeve having a sleeve length sufficient to

extend over a majority of the length of said shank when in the engaged position;

in the alternative, either (b)

> telescopingly engaging said sleeve onto said shank and (i)

thereafter positioning said shank and sleeve together within one sized

aperture or

positioning said shank without said sleeve being engaged (ii)

thereon within another sized aperture; and

thereafter engaging said locking head with said latch portion. (c)
